Abstract. How bacteria regulate, assemble and rotate flagella to swim in liquid media is reasonably well understood. Much less is known about how some bacteria use flagella to move over the tops of solid surfaces in a form of movement called swarming. The focus of bacteriology is changing from planktonic to surface environments, and so interest in swarming motility is on the rise.

Many swarming bacteria synthesize and secrete surfactants (short for “ surface active agent ”). Surfactants are amphipathic molecules that reduce tension between the substrate and the bacterial cell to permit spreading over surfaces. Surfactants often manifest as a clear, watery layer that precedes the cells at the swarm front11,29,45,49,64.

It was written as a “ field guide, ” but it could easily serve as a popular introduction to microbiology.
