Design a PID controller for a DC motor modeled in Simulink ®. Create a closed-loop system by using the PID Controller block, then tune the gains of PID Controller block using the PID Tuner. In this demonstration you will see how to quickly tune the PID controller for a planned model in Simulink. In this particular case, we model the DC motor.

PID motor control with an Arduino can be accomplished using simple firmware. In this example we use our Firstbot Arduino-Compatible controller to implement a PID based position controller using analog feedback and a potentiometer for control.

PID Motor Control with an Arduino - Solutions Cubed, LLC

Before we begin to design a PID controller, we need to understand the problem. In this example, we want to move the shaft of the motor from its current position to the target position. We want to move the output shaft of the motor from current position to target position. There are a few terms commonly used to describe the PID control loops, such as:
